

## TRASCO® ES: “0” backlash coupling

TRASCO® ES is our zero backlash coupling designed to compensate for misalignment and vibration dampening for

indexing applications. The compact design of TRASCO® ES makes it the right choice for all precise motion applications.

### Description

The TRASCO® ES consists of two hubs, which are either made of high-strength aluminum (up to the 38/45 size) or steel (from size 42) that are connected with an elastic element.

The precise dimensional characteristics of TRASCO® ES are obtained through our accurate machining process.

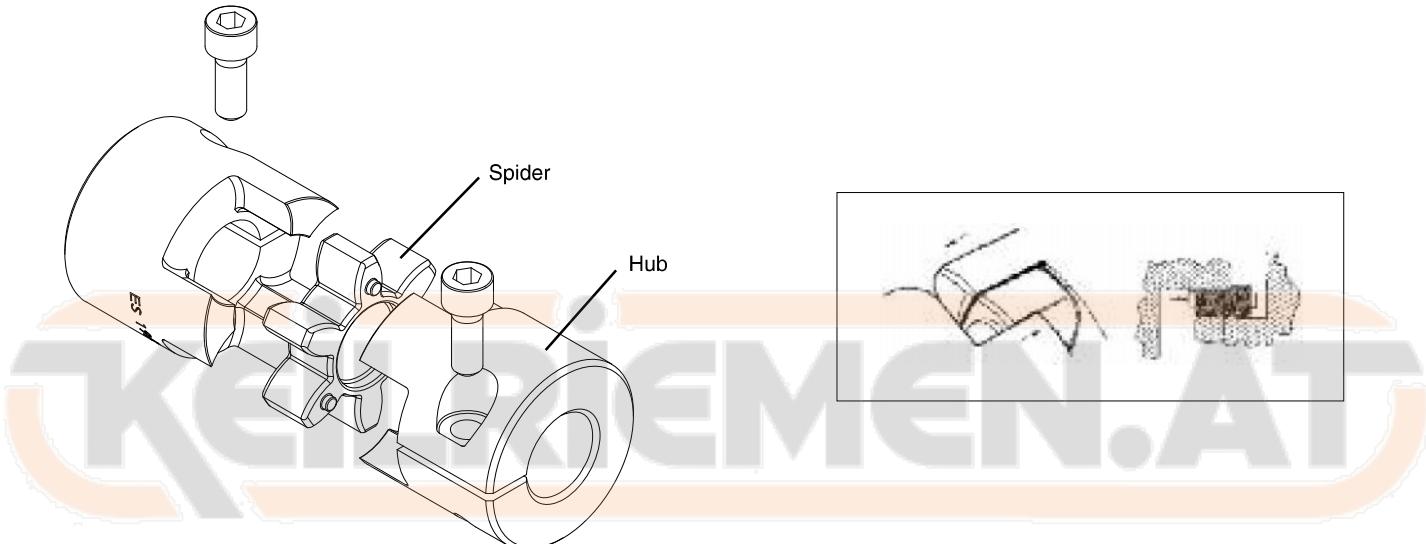

The special compound polyurethane elastic element, developed through extensive research and laboratory testing, is made through a press-forming process which guarantees high dimensional accuracy.

The element is available in 4 different hardnesses: **80 Sh. A (blue)**, **92 Sh. A (yellow)**, **98 Sh. A (red)**, **64 Sh. D (green)**.

Coupling performance depends on the type of element selected (see “**Technical characteristics**”).

Other element hardnesses are available upon request to meet special operating conditions, such as high temperatures and/or high torques, and for providing a high degree of vibration dampening capability. Please contact our Engineering Office for help in selecting the appropriate element hardness.

**Note:** It is possible to have aligned keyways upon inquiry.

### Operation

When the polyurethane element is installed in its special seats between the hubs, it becomes precompressed, thereby providing the zero backlash feature which characterizes the transmission performance of this coupling.

With zero backlash, the coupling remains torsionally rigid within the range of the precompression load, but does permit the

absorption of radial, angular, and axial misalignments as well as undesired vibrations.

The significantly wide precompressed area of the flexible element keeps the contact pressure against the elastic element low. Therefore, the element teeth can be overloaded many times without undergoing any wear or taking a permanent set.

## Advantages

The TRASCO® ES coupling provides the following advantages:

- “zero-backlash” motion transmission
- dampening (up to 80%) of vibrations from motor shaft
- low heat and electrical conductivity
- easy and fast installation
- perfect balance (A & AP type)
- low moment of inertia (due to compact design and types of materials used).

## Main applications

TRASCO® ES couplings are most frequently used with:

- servomotors
- robotics
- sliding tables
- spindle controls for drilling and grinding mandrels
- ball-bearing screws

## Operating Temperature Range

The operating temperature range for the TRASCO® ES depends on the type of element. For the **92° Sh. A (yellow)**, the range is between -40 and +90 °C, and for the **98° Sh.A (red)**, the range is between -30 and +90 °C. Peak temperatures as high as 120 °C can be tolerated for brief instances.

High operating temperatures can cause the elastic element to lose a considerable amount of elasticity, thus substantially lowering the torque handling capacity.

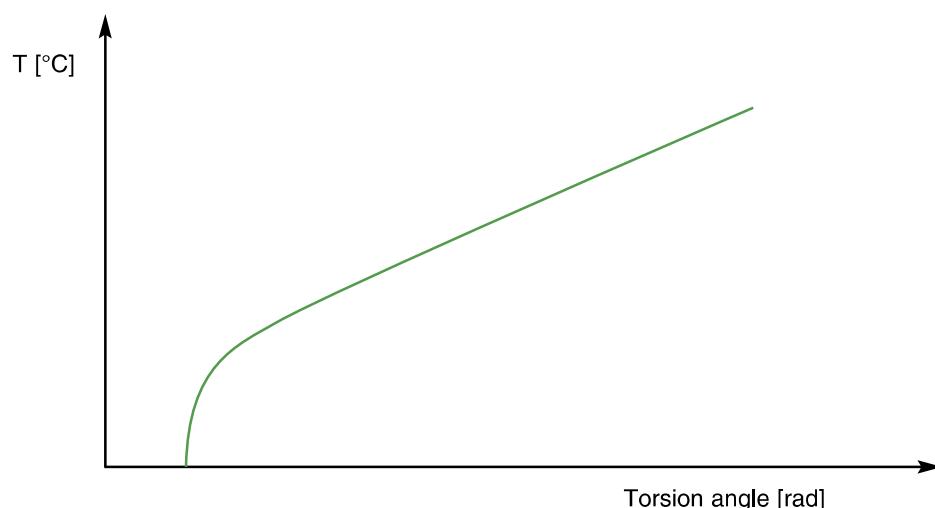

Therefore, when selecting a coupling, the operating temperature must be carefully considered (see “**Technical characteristics**”).

## ATEX Directive 2014/34/EU

It is possible to ask for specific certification for use in hazardous area according to EC standard **94/9/EC**. TRASCO® ES couplings are available with specific mounting/operating

instruction manual and conformity.

For information, please contact our technical office.

## Technical characteristics

The following technical characteristics apply to all types of TRASCO® ES couplings.

When using the M, A and AP versions, check the torque values given in the table against the allowable hub transmission values for the respective versions given in the pertinent sections.

TRASCO® ES couplings can withstand axial, radial, and angular misalignment.

Even after operating for an extended period with a misalignment, there is still zero backlash because the elastic element is only stressed by pressure loads.

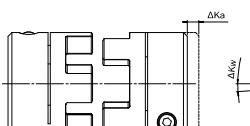

When an application causes a high degree of misalignment, a double flexing type coupling can be provided which avoids the formation of reaction forces.

Please contact our Engineering Office.

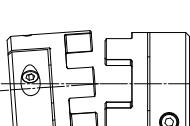

| Size  | Spider hardness  | Performances            |                           | Spider stiffness                 |                                 |                          | Misalignments           |                         |                        |

All the technical data in the catalogue are valid for rotation speeds of 1500 rpm and a working temperature of 30 °C.  
For linear speed over 30 m/s, dynamic balancing is recommended.

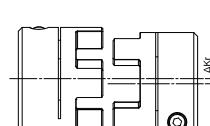

### Misalignments

Axial

Angular

Radial

|                   |                              |        |
|-------------------|------------------------------|--------|
| T <sub>KN</sub>   | Coupling nominal torque      | Nm     |
| T <sub>Kmax</sub> | Coupling maximum torque      | Nm     |
| C <sub>T</sub>    | Torsional rigidity           | N/mrad |
| C <sub>r</sub>    | Radial stiffness             | N/mm   |
| ΔK <sub>a</sub>   | Maximum axial misalignment   | mm     |
| ΔK <sub>r</sub>   | Maximum radial misalignment  | mm     |
| ΔK <sub>w</sub>   | Maximum angular misalignment | °      |

## Selection in according to DIN 740.2

The coupling must be chosen so the applied working loads do not exceed the allowable values whatever the working conditions are.

### 1. Check the load with respect to the nominal torque

The nominal coupling torque must be greater than or equal to the nominal torque of the drive machine for all working temperatures.

$$T_{KN} \geq T_K \cdot S_\theta \cdot S_D$$

### 2. Check the load with respect to the torque peak values

The maximum coupling torque must be greater than or equal to the torque peaks that occur during operation for all working temperatures.

$$T_{Kmax} \geq T_S \cdot S_Z \cdot S_\theta + T_K \cdot S_\theta \cdot S_D$$

Motor-side peaks:  $T_S = T_{AS} \cdot \frac{1}{m+1} \cdot S_A + T_L^{(1)}$

Driven-side peaks:  $T_S = T_{LS} \cdot \frac{m}{m+1} \cdot S_L + T_L^{(1)}$

### 3. Check the load with respect to periodic torque inversions

*By means of resonance*

When the resonance frequency is passed rapidly below the operational interval a few torque peaks will be seen. The generated alternating loads must be compared with the maximum torque the coupling can support.

$$T_{Kmax} \geq T_S \cdot S_Z \cdot S_\theta + T_K \cdot S_\theta \cdot S_D$$

Motor-side peaks:  $T_S = T_{AI} \cdot \frac{1}{m+1} \cdot V_R + T_L^{(1)}$

Driven-side peaks:  $T_S = T_{LI} \cdot \frac{m}{m+1} \cdot V_R + T_L^{(1)}$

### 4. Check the load with respect to nonperiodic torque inversions

To check the load with respect to nonperiodic torque inversions, the following equations must be satisfied:

$$0,25 T_{KN} = T_{KW} \geq T_W \cdot S_\theta \cdot S_f \cdot S_D$$

Motor-side peaks:  $T_W = T_{AI} \cdot \frac{1}{m+1} \cdot V_{fi}$

Driven-side peaks:  $T_W = T_{LI} \cdot \frac{m}{m+1} \cdot V_{fi}$

(1)  $T_L$  to be added if a torque peak occurs during acceleration.

## Calculation coefficients

### $S_\theta$ = Temperature factor

|            |         |     |     |     |
|------------|---------|-----|-----|-----|
| T [°C]     | -30/+30 | +40 | +60 | +80 |
| $S_\theta$ | 1       | 1,2 | 1,4 | 1,8 |

### $S_D$ = Torsional rigidity factor

| Tooling machines | Positioning system | Speed and angular acceleration indicator |
|------------------|--------------------|--|
| 2-5              | 3-8                | 10 ≥                                     |

### $S_V$ = Starting frequency factor

|       |       |         |         |         |           |
|-------|-------|---------|---------|---------|-----------|
| S/h   | 0-100 | 101-200 | 201-400 | 401-800 | 801-1.600 |
| $S_Z$ | 1     | 1,2     | 1,4     | 1,6     | 1,8       |

### $S_L$ o $S_A$ = Shock factor

| Type of impact | $S_L$ o $S_A$ |
|----------------|---------------|
| Light          | 1,5           |
| Medium         | 1,8           |
| Strong         | 2,2           |

### $S_f$ = Frequency factor

|         |     |               |
|---------|-----|---------------|
| f in Hz | ≤10 | >10           |
| $S_f$   | 1   | $\sqrt{f/10}$ |

$$V_{fi} = \text{Torque-Amplification factor} = \sqrt{\frac{1 + \left(\frac{\Psi}{2\pi}\right)^2}{\left(1 - \frac{n^2}{n_R^2}\right)^2 + \left(\frac{\Psi}{2\pi}\right)^2}}$$

$$n_R = \text{Resonance frequency} = \frac{30}{\pi} \sqrt{C_{Tdin} \frac{J_A + J_L}{J_A \cdot J_L}} \quad [\text{min}^{-1}]$$

$$m = \text{Mass factor} = \frac{J_A}{J_L}$$

## Example of selection

### Application

Servomotor driving a recirculating ball screw on a machine tool

|                   |  |                         |  |
|-------------------|--|-------------------------|--|
| Nominal Torque    | $T_K = 10,0 \text{ Nm}$                    | Shock Type              | Light                                      |
| Peak Torque       | $T_{AS} = 22,0 \text{ Nm}$                 | Table Moment of Inertia | $J_3 = 0,0038 \text{ kg} \cdot \text{m}^2$ |
| Rpm               | $n = 3.000 \text{ 1/min}$                  | Driven Shaft            | $dc = 20 \text{ mm h6 (without keyway)}$   |
| Moment of Inertia | $J_1 = 0,0058 \text{ kg} \cdot \text{m}^2$ | Motor Shaft             | $dm = 24 \text{ mm h6 (without keyway)}$   |
| Temperature       | $T = +40^\circ \text{C}$                   |                         |  |

### Selection

24/28 "A" type ES coupling with "Red" elastic element (98 Sh. A)

Standard coupling torque:

$$T_{KN} = 60 \text{ [Nm]}$$

$$T_{Kmax} = 120 \text{ [Nm]}$$

Maximum torque:

Hub Moment of Inertia:

$$J_2 = 0,000135 \text{ [kg} \cdot \text{m}^2\text{]}$$

Couple Transmitted by taper locking ring:

$$T_{cal} = \begin{cases} 92 \text{ [Nm] bore 20 [mm]} \\ 113 \text{ [Nm] bore 24 [mm]} \end{cases}$$

### Load check

$$T_{KN} = T_K \cdot S_\theta \cdot S_D = 10 \cdot 1,2 \cdot 4 = 48,0 \text{ [Nm]}$$

$$T_{KN} = 48,0 \text{ Nm} < T_{cal}$$

$$m = \frac{J_A}{J_L} \quad J_A = J_1 + J_2 \quad J_L = J_3 + J_2 \quad m = 1,5$$

$$T_S = T_{AS} \cdot \frac{1}{m+1} \cdot S_A = 22,0 \cdot \frac{1}{1,5+1} \cdot 1,5 = 13,2 \text{ [Nm]}$$

$$T_{Kmax} = T_S \cdot S_Z \cdot S_\theta + T_K \cdot S_\theta \cdot S_D = 13,2 \cdot 1,6 \cdot 1,2 + 12,5 \cdot 1,2 \cdot 4 = 85,34 \text{ [Nm]}$$

$$T_{Kmax} = 85,34 \text{ Nm} < T_{cal}$$

|                 |                               |                |
|-----------------|-------------------------------|----------------|
| $T_{KN}$        | Coupling nominal torque       | Nm             |
| $T_K$           | Motor-side nominal torque     | Nm             |

## TRASCO® ES executions

### FINISHED BORE HUBS EXECUTION

**GESF execution**

From size 7 to 9.  
Hub execution with finish bores,  
and two setscrew.

**GESF C execution**

From size 14.  
Hub execution with finish bore,

### CLAMP HUBS EXECUTION

**GESM execution**

Clamping hub execution.

**GESM...C execution**

Clamping hub execution with  
double slot and keyway.

**GESMC execution**

Compact clamping hub execution.

**GES2M execution**

Split clamping hub execution for  
radial assembly of the coupling  
torque depends on bore diameter.

### SHRINK DISC EXECUTION

**GESA execution**

Execution with locking ring. This  
execution is suitable for high  
speed and high torque. Screws  
mounting from spider side.  
Transmissible torque depends on  
bore diameter.

**GESAP execution**

Execution with locking ring with  
high machining accuracy: design  
suitable for application on spindles  
according to DIN 69002.

## Standard type

SIT coupling hubs are available from stock with either solid hub or with finished bores of standard shaft diameters.

The setscrews of our finished bore execution are positioned 120 degrees from each other with one positioned 180 degrees from

the keyway. Both the solid hub and bored hub coupling are generally available from stock for quick delivery.

**Approved according to ATEX Directive.**

## "M" execution with clamp hubs

This type of coupling permits quick, positive mounting, without any shaft-hub backlash.

With the keyless coupling type, the torque applied for tightening down the screws (Ms) must be as given in the table.

The M coupling type is available with or without keyway. Compliant with ATEX Directive.

Note: It is possible to have aligned keyways upon inquiry.

## “2M” execution with clamp hubs

Split clamping hub execution for radial assembly of the coupling torque depends on bore diameter.  
**Note:** It is possible to have aligned keyways upon inquiry.

## "A" type - Shrink disc execution

This type of coupling provides excellent kinetic uniformity. Furthermore, the absence of keys or set screws makes it a well-balanced coupling and greatly facilitates installation and removal. An exact radial/axial positioning is easy for those applications which require it. The absence of keyways also

avoids fretting corrosion and backlash between the shaft and the hub. This is the ideal type of coupling for applications requiring precision and/or high rotational speeds.

**Compliant with ATEX Directive.**

**Note:** It is possible to have aligned keyways upon inquiry.

Bore tolerances: H7.

For sizes 55 and 65 the shrinking ring depends on the diameter of the hole to be made. For further information please contact our Technical Department.

When using the coupling with hub in execution A, the maximum torque (transmissible by the shrink disk) will be the lower of that indicated in the table below and that indicated in the "Technical characteristics" section.

## “AP” type - Shrink disc execution according to DIN 69002

Precision “zero-backlash” coupling designed for multi spindle devices on machine tools or controls with reduced mass, such as short center spindles, multi-centers primary spindles in work sta-

tions, or joined to high speed bearings with limited tolerance range. It is suitable for very high speeds of rotation (up to speeds of 50 m/s).

## “GESS” double cardanic execution

This execution allows higher misalignments. The 2 spiders allow a high vibration dampening providing a decrease in drive noise and longer life of related components (ex. bearings).

The intermediate element is made of aluminum alloy and may be used in combination **with any type of hub execution**.

## “GES LR3” execution with intermediate shaft

Ideal execution for long distance shaft connections. Torque transmission is zero backlash. It is used in applications such as automatic machines, lifting machines, palletizing machines, and handling machines. Designed for length up to 4 m without bearing support (depending on rotation speed). The double slot

execution, allows spider mounting and replacement without driver/driven machine displacement. All aluminum alloy for a very low inertia.

**Note:** It is possible to have aligned keyways upon inquiry.

## Technical data for intermediate shaft couplings (GES LR1 - GES LR3)

| Size  | Misalignment                   |                                |
|-------|--------------------------------|--------------------------------|
|       | Assial<br>$\Delta K_a$<br>[mm] | Angular<br>$\Delta K_w$<br>[°] |
| 14    | 1,0                            | 0,9                            |
| 19/24 | 1,2                            | 0,9                            |
| 24/28 | 1,4                            | 0,9                            |
| 28/38 | 1,5                            | 0,9                            |
| 38/45 | 1,8                            | 0,9                            |

Radial misalignment

$$\Delta Kr = (L_z - 2 \cdot H - M) \cdot \tan(\Delta Kw) \quad [\text{mm}]$$

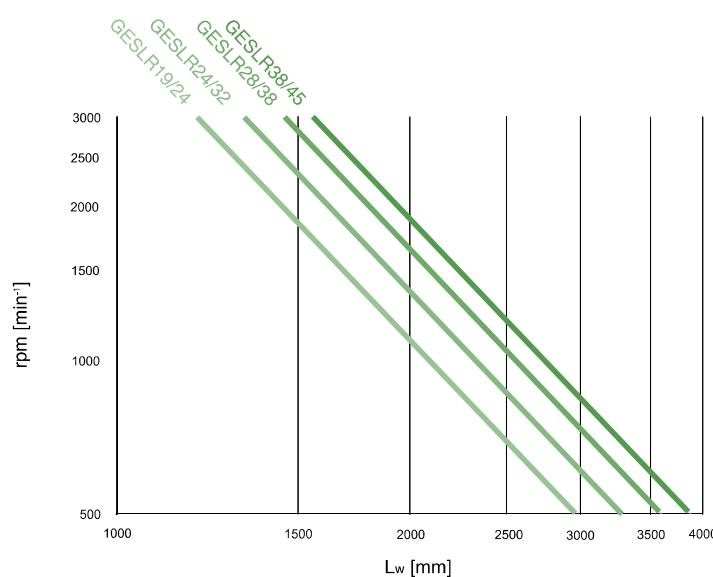

Angular misalignment = 0,9° for spider

$$C_{\text{Tot}} = \frac{1}{2 \cdot \frac{1}{C_{T \text{ spider}}} + \frac{L_{\text{intermediate shaft}}}{C_{T \text{ intermediate shaft}}}} \quad [\text{Nm/rad}]$$

$$L_{\text{intermediate shaft}} = \frac{L_{zw} - 2 \cdot L}{1000} \quad [\text{mm}]$$

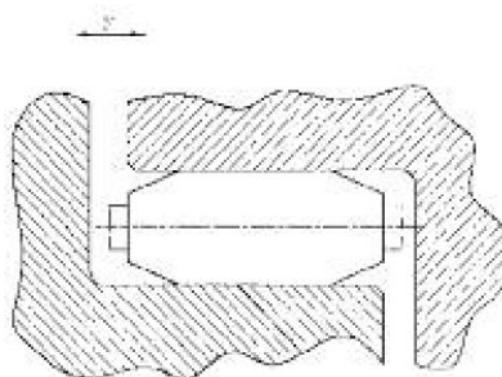

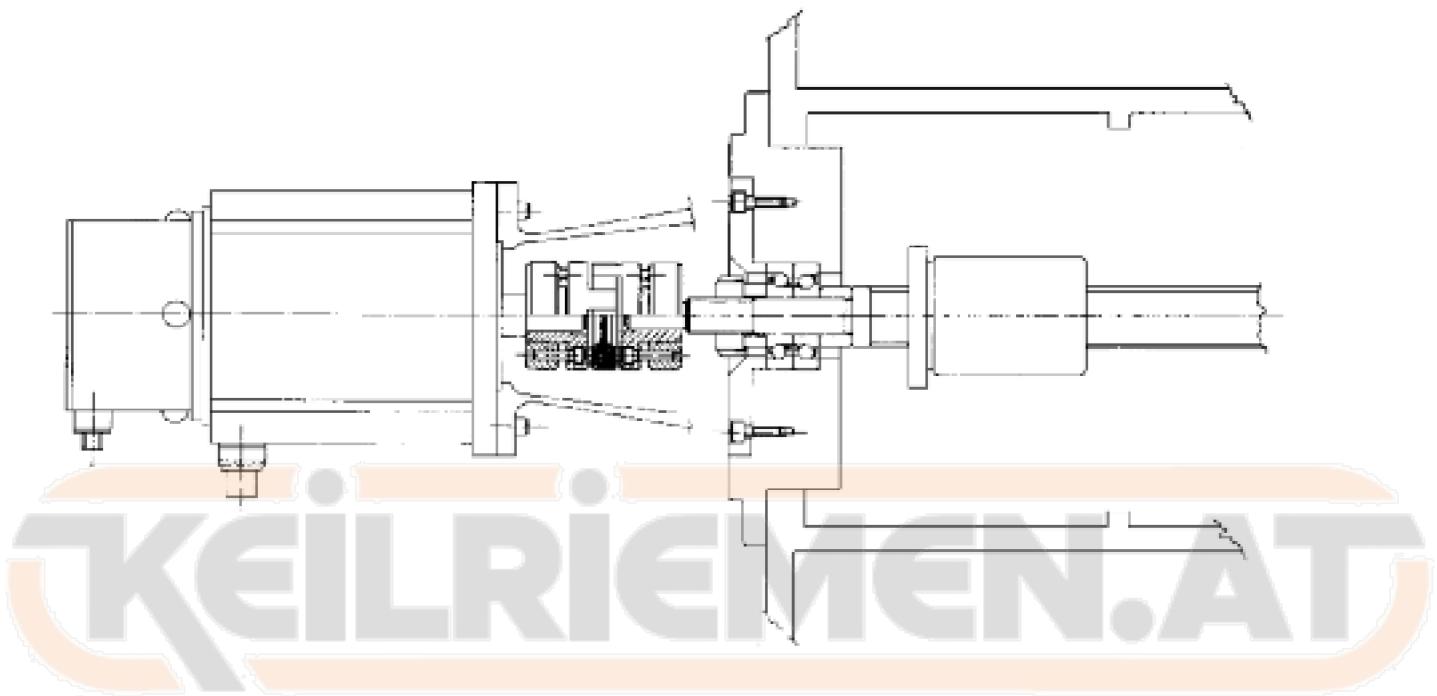

with  $L_{zw}$  = total coupling length

### Selection diagram GES LR3 coupling

## Installation and maintenance

1. Carefully clean the shafts
2. Insert the hubs onto shafts being connected. With the M, A and AP versions, be sure to tighten the screws with the Ms torque value given in the catalogue. Be careful with the A and AP versions to tighten the screws uniformly and crosswise to the recommended torque
3. Position the element in one of the two coupling hubs
4. Fit together the two coupling halves, making sure the "s" dimension is properly observed. This must be done to insure proper elastic element function and long service life, as well as to assure the coupling is properly insulated electrically

With the A and AP versions, mounting the hubs can be facilitated by lubricating the shaft contact surfaces with an oil, but **do not use a molybdenum bisulphide based oils.**

When mounting the TRASCO® ES coupling an axial thrust is generated which disappears when the mounting has been com-

pleted to avoid putting axial loads on the bearings.

Lubrication of the elastic element will reduce the amount of axial force required during installation

Note: All rotating parts must be guarded.
